

Implement a simple electromagnetic solver

## Implement a simple electromagnetic solver

#### Contents

• You will implement a simple two-equation solver from scratch, and validate it with a test case.

#### Prerequisites

- You are familiar with the directory structure of OpenFOAM applications.
- You are familiar with user compilation procedures of applications.
- You are familiar with the fundamental high-level components of application codes, and how new classes can be introduced to an application.

#### Learning outcomes

- You will practice high-level coding and modification of solvers.
- You will adapt case set-ups according to the new solver.
- You will improve your understanding of classes and object orientation, from a high-level perspective.

Note that you will be asked to pack up your final cleaned-up directories and submit them for assessment of completion.

## Problem: Electromagnetics of a rod surrounded by air

Geometry, computational domain, and rod/air regions.

#### Governing equations

Maxwell's equation:

 $\nabla \times E = 0 \tag{1}$ 

where E is the electric field strength.

$$\nabla \cdot B = 0 \tag{2}$$

where B is the magnetic flux density.

$$\nabla \times H = J \tag{3}$$

where H is the magnetic field strength and J is current density.

Charge continuity:

$$\nabla \cdot J = 0 \tag{4}$$

Ohm's law:

$$J = \sigma E \tag{5}$$

where  $\sigma$  is the electric conductivity. Constitutive law:

$$B = \mu_0 H \tag{6}$$

where  $\mu_0$  is the magnetic permeability of vacuum.

Combining Equations (1)-(6) and assuming Coulomb gauge condition ( $\nabla \cdot A = 0$ ) leads to a Poisson equation for the magnetic potential and a Laplace equation for the electric potential...

## Governing equations in OpenFoam

Magnetic potential:		Electric potential:	
$\nabla^2 A = \mu_0 \sigma(\nabla \phi)$	(7)	$\nabla \cdot [\sigma(\nabla \phi)] = 0$	(8)
<b>OpenFOAM</b> representation:		<b>OpenFOAM</b> representation:	
solve		solve	
(		(	
<pre>fvm::laplacian(A) ==</pre>		<pre>fvm::laplacian(sigma,ElPot)</pre>	
sigma*muMag*(fvc::grad(ElP	ot))	);	
);			

We see that A depends on  $\phi$ , but not vice-versa.

### Implementing the rodFoam solver

Create the basic files in your user directory:

cd \$WM\_PROJECT\_USER\_DIR
mkdir -p applications/solvers/electromagnetics/rodFoam
cd applications/solvers/electromagnetics/rodFoam
foamNewSource App rodFoam
tree

#### We see:

```
.
|-- Make
| |-- files
| `-- options
`-- rodFoam.C
```

Make sure that the binary file ends up in your user directory:

sed -i s/FOAM\_APPBIN/FOAM\_USER\_APPBIN/g Make/files

Try to compile. If it fails (for old versions), have a look at Make/options of e.g. \$FOAM\_SOLVERS/basic/laplacianFoam/Make/options to see that you should also add meshTools. This was a bug (or missing feature) in foamNewSource

## Add a few lines to rodFoam.C

We need a mesh to discretize our equations on, and we need to initialize properties and fields. After #include "createTime.H", add:

```
#include "createMesh.H" //In the OpenFOAM installation
#include "createFields.H" //Must be implemented - see next slides
```

Continue adding (after the above), our equations:

```
solve ( fvm::laplacian(sigma, ElPot) );
solve ( fvm::laplacian(A)==sigma*muMag*(fvc::grad(ElPot)) );
```

Add some additional things that can be computed when we know A and ElPot:

```
B = fvc::curl(A);
Je = -sigma*(fvc::grad(ElPot));
```

We also want to write out the results to a new time directory. Continue adding:

```
runTime++;
sigma.write();
ElPot.write();
A.write();
B.write();
Je.write();
```

## The createFields.H file (1/6)

We need to construct and initialize muMag, sigma, Elpot, A, B, and Je. Edit the createFields.H file.

#### Read muMag from a dictionary:

```
Info<< "Reading physicalProperties\n" << endl;</pre>
IOdictionary physicalProperties
    IOobject
        "physicalProperties",
        runTime.constant(),
        mesh,
        IOobject::MUST_READ,
        IOobject::NO_WRITE
);
dimensionedScalar muMag
    "muMag",
    dimensionSet(1, 1, -2, 0, -2, 0, 0),
    physicalProperties
);
```

### The createFields.H file (2/6)

```
Construct volScalarField sigma:
```

### The createFields.H file (3/6)

Construct volScalarField Elpot:

Cosse Håkan Nilsson, Chalmers / Mechanics and Maritime Sciences / Fluid Dynamics 10

#### The createFields.H file (4/6)

```
Construct volVectorField A:
```

#### The createFields.H file (5/6)

```
Construct and initialize volVectorField B:
```

#### The createFields.H file (6/6)

Construct and initialize volVectorField Je:

```
volVectorField Je
(
            IOobject
            (
            "Je",
            runTime.timeName(),
            mesh,
            IOobject::NO_READ,
            IOobject::AUTO_WRITE
            ),
            -sigma*(fvc::grad(ElPot))
);
```

### Compile the solver

We have implemented a solver, which is compiled by:

wmake

#### If successful, the output should end something like:

-o /chalmers/users/hani/OpenFOAM/oscfd-plus/platforms/linux64GccDPInt32Opt/bin/rodFoam

We now need a case to use the solver on. It is provided to you (rodFoamCase.tgz), since it is too much to describe in slides. Unpack and run using: (NOTE, you may have to do sudo apt install gv first, for showing the plots at the end) tar xzf rodFoamCase.tgz; cd rodFoamCase; ./Allrun 2>&1 | tee log\_Allrun

### Boundary and initial conditions

• We solve for the magnetic potential A(A) and the electric potential ElPot ( $\phi$ ), so we need boundary conditions:

	block 0, sides	block 1, sides	block1, top
A	$\nabla A = 0$	$\nabla A = 0$	A = 0
$\phi$	$\phi_{left} = 707, \phi_{right} = 0$	$\nabla \phi = 0$	$\nabla \phi = 0$

and we initialize the fields to zero.

**CHALMERS** 

• The internal field of the electric conductivity sigma ( $\sigma$ ) is nonuniform:

 $\sigma = \begin{cases} 2700 & \text{if } x < R \text{ where } \mathbf{R} \text{ -radius of the block 1} \\ 1e - 5 & \text{otherwise} \end{cases}$ 

so we use a volScalarField and setFields to set the internal field.

• The magnetic permeability of vacuum ( $\mu_0$ ) is read from the constant/physicalProperties dictionary.

#### View the results in paraFoam

## Validation of components of A and B using Gnuplot

- Our numerical results should be validated with analytical results
- For this we need to extract the components and extract the values along a line: postProcess -func 'components(A)' -time 1 postProcess -func 'components(B)' -time 1 postProcess -func singleGraph -time 1
- The results are validated with the analytical solution using Gnuplot: gnuplot rodComparisonAxBz.plt

```
• Visualize using:
display rodAxVSy.png
display rodBzVSy.png
```

#### CFD with OpenSource Software, 2022

**CHALMERS** 

## Validation of components of A and B using Gnuplot

#### Analytic solution

• Analytic solution for x component of magnetic potential vector A

$$A_x = \begin{cases} A_x(0) - \frac{\mu_0 J x^2}{4} & \text{if } r < R, \\ A_x(0) - \frac{\mu_0 J R^2}{2} [0.5 + \ln(r/R)] & \text{otherwise} \end{cases}$$

where  $A_x(0) = 0.000606129$ , J = 19.086e + 7 is the current density and R is the radius of the electric rod.

 $\bullet$  Analytic solution for z component of magnetic field B

$$B_z = \begin{cases} \frac{\mu_0 J x}{2} & \text{if } r < R, \\ \frac{\mu_0 J R^2}{2r} & \text{otherwise} \end{cases}$$

where J = 19.086e + 7 is the current density and R is the radius of the electric rod.

• Have a look in rodComparisonAxBz.plt to see how to plot a function in Gnuplot.
