## J MTF270: Computation of wavenumber vector and angles

For each mode  $n$ , create random angles  $\varphi^n$ ,  $\alpha^n$  and  $\theta^n$  (see Figs. J.1 and 22.1) and random phase  $\psi^n$ . The probability distributions are given in Table J.1. They are chosen so as to give a uniform distribution over a spherical shell of the direction of the wavenumber vector, see Fig. J.1.

### J.1 The wavenumber vector, $\kappa_j^n$

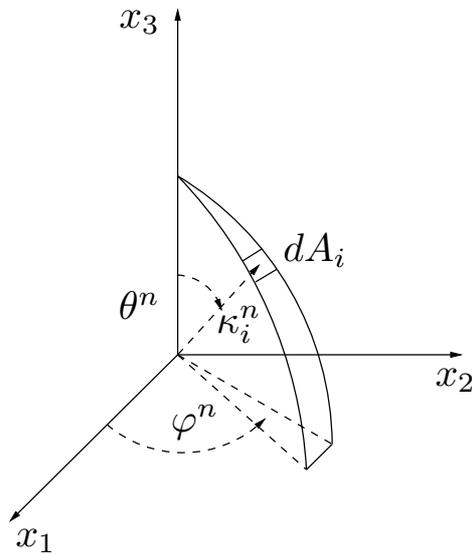

Figure J.1: The probability of a randomly selected direction of a wave in wave-space is the same for all  $dA_i$  on the shell of a sphere.

Compute the wavenumber vector,  $\kappa_j^n$ , using the angles in Section J according to Fig. J.1, i.e.

$$\begin{aligned}\kappa_1^n &= \sin(\theta^n) \cos(\varphi^n) \\ \kappa_2^n &= \sin(\theta^n) \sin(\varphi^n) \\ \kappa_3^n &= \cos(\theta^n)\end{aligned}\tag{J.1}$$

$p(\varphi^n) = 1/(2\pi)$	$0 \leq \varphi^n \leq 2\pi$
$p(\psi^n) = 1/(2\pi)$	$0 \leq \psi^n \leq 2\pi$
$p(\theta^n) = 1/2 \sin(\theta)$	$0 \leq \theta^n \leq \pi$
$p(\alpha^n) = 1/(2\pi)$	$0 \leq \alpha^n \leq 2\pi$

Table J.1: Probability distributions of the random variables.

$\kappa_i^n$	$\sigma_i^n$	$\alpha^n$
(1, 0, 0)	(0, 0, -1)	0
(1, 0, 0)	(0, 1, 0)	90
(0, 1, 0)	(0, 0, -1)	0
(0, 1, 0)	(-1, 0, 0)	90
(0, 0, 1)	(0, 1, 0)	0
(0, 0, 1)	(-1, 0, 0)	90

Table J.2: Examples of value of  $\kappa_i^n$ ,  $\sigma_i^n$  and  $\alpha^n$  from Eqs. J.1 and J.3.

## J.2 Unit vector $\sigma_i^n$

Continuity requires that the unit vector,  $\sigma_i^n$ , and  $\kappa_j^n$  are orthogonal. This can be seen by taking the divergence of Eq. 22.1 which gives

$$\nabla \cdot \mathbf{v}' = 2 \sum_{n=1}^N \hat{u}^n \cos(\boldsymbol{\kappa}^n \cdot \mathbf{x} + \psi^n) \boldsymbol{\sigma}^n \cdot \boldsymbol{\kappa}^n \quad (\text{J.2})$$

i.e.  $\sigma_i^n \kappa_i^n = 0$  (superscript  $n$  denotes Fourier mode  $n$ ). Hence,  $\sigma_i^n$  will lie in a plane normal to the vector  $\kappa_i^n$ , see Fig. 22.1. This gives

$$\begin{aligned} \sigma_1^n &= \cos(\varphi^n) \cos(\theta^n) \cos(\alpha^n) - \sin(\varphi^n) \sin(\alpha^n) \\ \sigma_2^n &= \sin(\varphi^n) \cos(\theta^n) \cos(\alpha^n) + \cos(\varphi^n) \sin(\alpha^n) \\ \sigma_3^n &= -\sin(\theta^n) \cos(\alpha^n) \end{aligned} \quad (\text{J.3})$$

The direction of  $\sigma_i^n$  in this plane (the  $\xi_1^n - \xi_2^n$  plane) is randomly chosen through  $\alpha^n$ . Table J.2 gives the direction of the two vectors in the case that  $\kappa_i$  is along one coordinate direction and  $\alpha = 0$  and  $\alpha = 90^\circ$ .
